

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE

IN these Tables I have followed the arrangement of ordinary Azimuth Tables as that most convenient to Navigators, the plan adopted by Lieutenant J. F. R. Bateman, Royal Navy, and Captain James Bairnson in their excellent works. Other arrangements might have made the book smaller, but at the same time not so convenient.

As this is not a text-book, I have not taken up space with rules for the conversion of time, finding hour angles, and for plotting lines of position by the usual methods familiar to Navigators, which may be found in any work on navigation. Attention, however, is called to the use of Ex-Meridian Tables in connection with Commandant Marcq Saint-Hilaire's method, the "New Navigation." In this method the "Reduction to the Meridian" is added to the meridian zenith distance to obtain the calculated zenith distance. For a full explanation the reader is referred to "Navigation and Nautical Astronomy," by Staff-Commander W. R. Martin, Royal Navy; "Navigation and Compass Correction," by Commander W. C. P. Muir, U. S. Navy, and "Explanation of the Method of the New Navigation," by Naval Instructor J. R. Walker, Royal Navy.

Every care has been taken to guard against errors, and the tabulated "First Reductions" have been compared, as far as practicable, with the results given in Bairnson's Tables and other works.

The methods for the identification of stars here given are very simple and will at times be found most useful.

In the accompanying plates I have introduced a number of new diagrams which I believe will be found upon trial more convenient than the corresponding tables, which in some cases have been also inserted. In using the plates no interpolation is necessary.

A few examples have been worked to illustrate the use of the various tables and diagrams.

In the preparation of this book and plates I have to acknowledge the assistance received from the following works:

Chauvenet's "Astronomy;" Chauvenet's "Trigonometry."

Rice and Johnson's "Differential Calculus."

Bairnson's "Ex-Meridian Tables."

"Short Method Ex-Meridian Tables," by Lieutenant J. F. R. Bateman, R.N.

"Notes on Navigation," by Commander P. F. Harrington, U. S. Navy.

Coffin's "Navigation."

Bowditch's "American Practical Navigator."

"Azimuth Tables," — Hydrographic Office.

"Ex-Meridian Tables," by Brent, Walter, and Williams.

Chambers' "Mathematical Tables."

"The Practice of Navigation," by Lieutenant Henry Raper, Royal Navy.

"Navigation and Nautical Astronomy," by Staff-Commander W. R. Martin, R.N.

"A Companion to the Epitome of Navigation," by Captain H. S. Blackburne.

"Navigation and Nautical Astronomy," by J. Gill, F.R.A.S.

"Ex-Meridian Tables for Sun or Star," by Captain A. J. MacHattie.

"Navigation and Compass Correction," by Commander W. C. P. Muir, U. S. Navy.

Lecky's "General Utility Tables."

"Nautical Tables for Ex-Meridian Observations," by Bossen and Mars.

"Solving the Ex-Meridian Problem on Kinematic Principles," by H. B. Goodwin, Royal Navy.

This last book was received as these Tables were going to press, and I find that Table V is practically the same as the table given by Mr. Goodwin. His rules for finding the "First Reduction" are:

"(1) With latitude, declination, and half hour angle, take from the Azimuth Tables of Burdwood, Davis, or Goodwin the approximate Azimuth.

"(2) With the Azimuth so obtained, and latitude, take out 'rate of change' from the Table.

"(3) Multiplying this rate by the number of minutes of time in the whole hour angle we have the 'Reduction.' "

It may be shown from formulas (22) and (23) that $C_t^1 = \frac{1}{2} C_t^1$ hence, $\Delta h = C_t^1 \times \frac{t}{2} = \frac{1}{2} C_t^1 \times t = C_{\frac{t}{2}}^1 \times t$, that is, rule (3) gives the same value for the "First Reduction" as that given in the text.

Mr. Goodwin's pamphlet will be found a most useful addition to the library of every Navigator.

For the Table giving the values of "B" used in the identification of stars, I am indebted to Professor H. L. Rice, U. S. Navy, and also for the formula by which Table VII was computed, and to Commanders W. C. P. Muir and T. C. Fenton, U. S. Navy, for reviewing the text.

ARMISTEAD RUST,

Lieut.-Commander, U. S. Navy.

N. B.—The plates will be found at the end of the volume. While it is not advisable to remove the plates from the book for fear of losing them, it will be found convenient in practice and tend to preserve the plates to have an extra set pasted on heavy cardboard for every-day use.

Additional sets of plates may be obtained for \$1.00 per set.

Explanation of the Tables.

In the astronomical triangle PMZ , P is the elevated pole, M the position of the observed body, Z the zenith of the observer, L his latitude, d the declination and h the altitude of the observed body; $90^\circ - h$ = the zenith distance of this body. Let h_o = the meridian altitude of M , then $90^\circ - h_o$ = meridian zenith distance of M .

The reduction to the meridian is that arc which applied to the true altitude of an observed body will give the meridian altitude of that body at the place of observation.

Delambre's formula for the reduction to the meridian is:

(1) Reduction to the meridian (in seconds of arc) =

$$\pm \frac{\cos L \cos d}{\sin(L \pm d)} \times \frac{2 \sin^2 \frac{1}{2} t}{\sin 1''} - \left(\frac{\cos L \cos d}{\sin(L \pm d)} \right)^2 \times \frac{2 \sin^4 \frac{1}{2} t \cot(L \pm d)}{\sin 1''},$$

where t is in seconds of time.

The positive sign for the first term corresponds to an observation near the upper transit and the negative sign to an observation near the lower transit, when the hour angle is reckoned from the lower branch of the meridian. The upper sign in the expression $(L \pm d)$ for the zenith distance corresponds to a case when the latitude and the declination are the same name, and the lower sign when they are of contrary names, or for lower transit.

The first term of (1) is the first reduction to the meridian and the second term

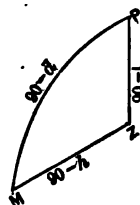

FIG. 1.

ERRATA.

Page vii, line 18, insert comma after "upper transit," and in line 19 omit comma after "lower transit."

Page x, line 6 from bottom, insert semicolon after "observed body."

Page xii, last line, "latitude" should be "altitude."

Page xxiv, line 2, "Eriadni" should be "Eridani."

$$(6) \Delta h = \pm \frac{\Delta n \times r}{60}.$$

Raper's formula for the second reduction to the meridian is

(7) $\sin(\text{second reduction}) = K \sin^2 \Delta h \tan h_o = \theta$,
where K is a constant and $\log K = 9.6990$; hence,

(8) Second reduction = $\sin^{-1} \theta$ and

(9) Reduction to the meridian = $\pm \Delta h - \sin^{-1} \theta$.

The values of Δh are given in the tables opposite the respective hour angles, in minutes and seconds, and Plate I gives the values of the second reduction corresponding to any given meridian altitude and first reduction.

TABLE V.

ALTITUDE-AZIMUTH TABLE.

From this table the true azimuth may be obtained from the change of altitude in one minute.

From No. 285, Chauvenet's Trigonometry (10th edition), we have:

(10) $\Delta h = \cos Z \Delta L + \cos M \Delta d - \cos L \sin Z \Delta t$.

Let L and d be constant, then

(11) $\Delta h = -\cos L \sin Z \Delta t$. If $\Delta t =$ one minute in time, we have

(12) $\Delta h = -15 \cos L \sin Z$, corresponding to the hour angle t , which gives the azimuth Z .

Denote this value of Δh by C_1' , then

(13) $C_1' = -15 \cos L \sin Z =$ the change in altitude in one minute corresponding to the hour angle t , which is also the error in the altitude or the first reduction due to an error of one minute in the hour angle at the hour angle t corresponding to the azimuth Z .

Table V was computed from formula (13). When $Z = 90^\circ$;

(13a) $C_1' = -15 \cos L$.

TABLE VI.

ERROR IN THE FIRST REDUCTION DUE TO AN ERROR IN THE LATITUDE USED IN THE COMPUTATION.

This table was computed from the formula

(14) $\Delta h = \Delta L (1 - \cos Z)$ derived from the formula for Table VII.

TABLE VII.

ERROR IN THE LATITUDE DUE TO AN ERROR IN THE LATITUDE USED IN THE COMPUTATION.

The formula deduced by Professor H. L. Rice, U. S. Navy, is

(15) $\Delta L_1 = 2 \Delta L_0 \sec Z \sin^2 \frac{Z}{2} \left\{ 1 + \Delta L_0 \tan h \cos^2 \frac{Z}{2} \right\}$,

h being the observed altitude. ΔL_0 in the parenthesis must be expressed in radians. For the practical purposes of navigation at sea we may neglect the second term in the parenthesis, and we have

(16) $\Delta L_1 = 2 \Delta L_0 \sec Z \sin^2 \frac{Z}{2}$, from which Table VII was computed. In this

formula $\Delta L_0 =$ the difference between the latitude by observation and the latitude by dead reckoning.

$\Delta L_1 =$ correction to be applied to the computed latitude.

Explanation of the Plates.

PLATE I.

DIAGRAM FOR THE SECOND REDUCTION TO THE MERIDIAN.

This diagram shows the value of the second reduction computed by Raper's formula: $\sin(\text{second reduction}) = K \sin^2(\text{first reduction}) \times \tan(\text{meridian altitude})$, where $\log K = 9.6990$.

PLATE II.

ALTITUDE-AZIMUTH DIAGRAM.

This diagram expresses graphically formula (13), (23) and Table V, and may be used with Prestel's method for finding the approximate latitude near the prime vertical.

PLATE III.

TIME-AZIMUTH DIAGRAM.

We have from (11) $\Delta h = -\cos L \sin Z \Delta t$.

Let $\Delta h = 1'$ of arc, then

(17) $\Delta t = -4 \sec L \operatorname{cosec} Z$, where Δt is the number of seconds of time necessary to change the altitude one minute. Plate III shows formula (17).

PLATES IV AND V.

ERROR IN THE LATITUDE DUE TO AN ERROR OF ONE MINUTE OF TIME IN THE HOUR ANGLE OR LONGITUDE.

We have (11) $\Delta h = -\cos L \sin Z \Delta t$; if $\Delta t = 1$ minute in time, $\Delta h = -15 \cos L \sin Z$; but $\Delta L = \sec Z \Delta h$, hence

(18) $\Delta L = -15 \cos L \tan Z$. Plates IV and V were constructed by this formula.

PLATE VI.

STAR-FINDING DIAGRAM.

Represents the formulas

$$(19) \sin Z \cos h = \sin t \cos d;$$

$$(20) \sin Z \cos L = \sin M \cos d.$$

To find the Star's Declination from the Diagram.

Enter with the azimuth on the margin; the intersection of the horizontal line through this point with the curve corresponding to the true altitude fixes a vertical line the intersection of which with the horizontal line corresponding to the hour angle previously found, determines the curve corresponding to the declination of the body.

The Use of the Tables.

To find the latitude it is necessary to know

1. The latitude by dead reckoning = L .
2. The declination at time of observation = d .
3. The hour angle at time of observation = t .
4. The true altitude of the observed body = h .

The reduction to the meridian is that arc which applied to the true altitude of an observed body will give the meridian altitude of that body at the place of observation.

Δh = the first reduction to the meridian, in minutes, for the hour angle of observation, t .

- (2) Reduction to meridian = $\pm$ first reduction - second reduction.
 Reduction to meridian = $\pm \Delta h$ - second reduction.

The first reduction, Δh , is found on the page for the latitude by dead reckoning (to the nearest degree), under the declination of the body (to the nearest degree), and opposite the hour angle.

If the exact hour angle is not found in the table, correct by simple interpolation for the odd minutes and decimals.

The correction thus found will be sufficiently exact for practical purposes, except when the meridian zenith distance is small or the hour angle large; then the hour angle must be corrected by Table V, or it may be readily computed by formula:

$$(6) \quad \Delta h = \pm \frac{\Delta_1 h \times t^2}{60}.$$

Formula (6) may be used to find the first reduction when the hour angle of the body exceeds the tabular hour angle.

$\Delta_1 h$ = the change in altitude in one minute from meridian passage with its logarithm, is given for this purpose; then

- (21) $\log \Delta_1 h = 2 \log t + \log \Delta_1 h + 8.22185$ (colog 60).

When very exact results are desired the corrections for the minutes of declination and latitude may be made with the aid of Table VI.

In each column of declination is given the "limit" of the hour angle for which the value of the second reduction is less than one minute, about 45 seconds. The second reduction, however, may be readily found from Plate I by entering with the meridian altitude at the bottom and the first reduction on the curves. The meridian altitude is given in each column of declination for this purpose.

When the altitude was observed near the upper transit, add the reduction to the meridian to the true altitude of the observed body when near the lower transit, subtract the reduction (first and second combined) from the true altitude; the result is the meridian altitude of the body at the place of observation, and if the sun was observed, the latitude found must be corrected for the run to noon in order to find the latitude at noon.

TABLE I.

LOGARITHMS OF NUMBERS FROM 0 TO 999.

This table may be used to find the logarithm of a number of five figures or to find to five places the number corresponding to any given logarithm by using the proportional parts.

To find the logarithm of a number of five figures.

RULE. To the logarithm of the first three figures add the product of the last two figures multiplied by the proportional part found opposite the first three figures after pointing off seven places from the right.

EXAMPLE:— Find the logarithm of 35.674.

35.6	log 1.55145	.00122
	.00090	.74
35.674	log 1.55235	488
		854
		.0009028

RULE. To find to five places the number corresponding to a given logarithm.

Find the logarithm next less than the given logarithm and take out the corresponding number for the first three figures. Subtract this logarithm from the given logarithm and divide the remainder by the proportional part opposite the first three figures, to two places, and annex the quotient to the right of the three figures already found; point off from the left the whole number determined by the characteristic.

EXAMPLE:— Find the number corresponding to log 3.79643.

6250.0	log 3.79588	$\frac{1}{2}$ = .78
6257.8	log 3.79643 (given)	
	Diff. 55	Required number = 6257.8

TABLES II, III, IV.

For correcting the observed altitudes of the sun and stars. First apply the index correction, then the corrections from the tables.

TABLE V.

ALTITUDE-AZIMUTH TABLE AND THE ERROR IN THE FIRST REDUCTION DUE TO AN ERROR OF ONE MINUTE IN THE HOUR ANGLE.

To find the azimuth.

It is necessary to know the change of altitude in one minute corresponding to the hour angle of observation. Now we have

$$(6) \Delta h = \pm \frac{\Delta h \times t^2}{60} \text{ in minutes of arc, } t \text{ being in minutes of time.}$$

Differentiating, Δh being constant,

$$d(\Delta h) = \pm \frac{\Delta h \times t}{30} dt.$$

If $dt = 1$ minute of time, then $d(\Delta, h) = \pm \frac{\Delta, h \times t}{30}$ — the change in altitude in one minute or rate of change per minute corresponding to the hour angle t and the azimuth Z .

Denote this by C_t . Then

$$(22) \quad C_t = \pm \frac{\Delta, h \times t}{30};$$

hence to find the change of altitude in one minute, multiply the change of altitude in one minute from meridian passage (Δ, h) for the given latitude and declination by the hour angle in minutes and decimals and divide by 30. With this number, C_t , enter Table V or Plate II with the latitude for the azimuth.

The first reduction may also be found thus:

$$(6) \quad \Delta, h = \pm \frac{\Delta, h \times t^2}{60} = \pm \frac{\Delta, h \times t}{30} \times \frac{t}{2}; \text{ hence from (22)}$$

$$(23) \quad \Delta, h = \pm C_t \times \frac{t}{2}.$$

Therefore, find the change in altitude in one minute corresponding to the whole hour angle of the body and multiply this by one-half of the hour angle of the body.

If the declination is used instead of the latitude, the position angle, M , will be found in place of the azimuth in Table V and Plate II.

Table V also shows the error in the first reduction or the altitude due to an error of one minute in the hour angle, and may therefore be used, when the azimuth is known, for correcting the first reduction for the odd minutes and decimals of hour angle. That is, when the azimuth has been found from the Azimuth Tables, enter Table V with the azimuth and latitude, multiply the value of C_t thus found by the minutes of hour angle, and apply the result to the first reduction corresponding to the tabular hour angle. When formula (22) is used to find the azimuth this value of C_t should be used for correcting Δ, h for the odd minutes of hour angle.

TABLE VI.

ERROR IN THE FIRST REDUCTION DUE TO AN ERROR IN THE LATITUDE
USED IN THE COMPUTATION.

This table is used to correct the first reduction for the difference between the latitude by dead reckoning and the tabular latitude for which the first reduction was taken out, but is only needed when great accuracy is required.

The way to apply the correction to the first reduction, Δ, h , may be easily determined by looking on the page for the next degree of latitude in the same declination column to see whether the first reduction increases or decreases with an increase of latitude, and in the same manner determine the sign for the correction for minutes of declination which may be found from this table as there directed. All corrections should be made to Δ, h before this is applied to the latitude.

TABLE VII.

ERROR IN THE LATITUDE DUE TO AN ERROR IN THE LATITUDE USED IN THE COMPUTATION.

Enter with the azimuth and the difference between the latitude used and the latitude by observation. The correction found must be so applied to the latitude by observation as to bring this latitude numerically between the true latitude and the latitude by dead reckoning used; thus, D.R. - Obs. - True, or True - Obs. - D.R.; that is:

1. When the latitude by D.R. is greater than that by observation, subtract the correction from the latter.
2. When the latitude by D.R. is less than that by observation, add the correction to the latter.

Use of the Plates.

PLATE I.

DIAGRAM FOR THE SECOND REDUCTION TO THE MERIDIAN.

Enter with the meridian altitude corresponding to the given latitude and declination at the bottom of the diagram. The intersection of the vertical line at this point with the curve corresponding to the first reduction gives the second reduction on the margin.

PLATE II.

ALTITUDE-AZIMUTH DIAGRAM.

This diagram corresponds to Table V, but it is not on a sufficiently large scale for interpolating for the odd minutes of hour angle, except the enlarged portion, which includes azimuths up to 14° .

To find the azimuth, first find C_1' (see formula (22), Table V) and enter with C_1' and the latitude. If the declination is used instead of the latitude, the position angle, M , will be found in place of the azimuth.

From formula (13) we have

$$(24) \sin Z = -\frac{C_1'}{15} \sec L. \text{ The value of } C_1' \text{ may be computed from formula}$$

(22) as long as the hour angle does not exceed the "limit" given in the tables; that is, the second reduction must be practically zero. Plate II expresses formula (24).

The value of C_1' may be found in practice by dividing the difference between two altitudes by the number of minutes in the elapsed time; and correcting the quotient for the run of the ship in the interval. See remarks under (25).

The azimuth obtained from this diagram, being negative, must be reckoned from the depressed pole, or its supplement from the elevated pole.

From an inspection of the Azimuth Tables these rules will be seen to hold good, the azimuth being always less than 90° .

1. Mark the azimuth east or west like the hour angle.
2. When the latitude is 0° give the azimuth the same name as the declination.
3. When the latitude and the declination are of the same name and the latitude is less than the declination, the azimuth has the same name.
4. When the latitude and declination are of the same name and the declination less than the latitude, the azimuth is of the contrary name, for the limit of the diagram, that is, until the body reaches the prime vertical, after which it is of the same name.
5. When the latitude and declination are of contrary names the azimuth has the same name as the declination.

When the body is so near the prime vertical as to cause any doubt, refer to Table IX, "Altitudes on the Prime Vertical"; when the altitude is greater than the tabular altitude, the azimuth is of the contrary name; when less, of the same name. Plate II was designed for use with "Ex-Meridian Altitudes" and should be used with great care when the body is near the prime vertical, as here a small error in C_1' will cause a large error in the azimuth.*

To find the Hour Angle of an Observed Body and the Latitude when the Time is not known.

Formula (22) $C_1' = \pm \frac{\Delta_1 h \times t}{30}$, from which

$$(25) \quad t = \pm \frac{C_1' \times 30}{\Delta_1 h},$$

from which t may be found in minutes when it does not exceed the limits given, that is, when the second reduction is practically zero, and when the conditions are good the longitude may be found with considerable accuracy.

By dividing the difference of altitudes by the interval we obtain the change in altitude in one minute, due to combined motion of ship and body, which corrected for run gives C_1' .

Unless the ship be steering a course at right angles to the direction of the body, the change in altitude in one minute must be corrected for the run of the ship; that is, if D minutes is the speed of the ship per hour, then D seconds is the speed per minute and the correction = $D'' \cos(\text{course} - \text{azimuth})$. Enter the Traverse Tables with D'' as a distance and $(C - Z)$ as a course, then the correction is found in the latitude column, to be subtracted from the observed change of altitude per minute when the ship is moving towards the body, and to be added when moving away from the body; in other words, when $(C - Z)$ is less than 90° , subtract; when $(C - Z)$ is greater than 90° , enter with the supplement of $(C - Z)$ and

* To compute C_1' on, or very near, the prime vertical: Multiply the natural cosine of the Latitude by 15. See (13a).

add the correction. The above rules apply when the body is rising; when falling, add when approaching and subtract when separating.

To make this method of any value the following must be observed:

1. The altitudes must be observed with the greatest accuracy, with an interval of not less than five minutes between them.
2. The hour angle must be within the "limit" so that the second reduction may be regarded as zero.
3. The correction for run must be accurately known and correctly applied.
4. The watch time corresponding to the hour angle t is the mean of the watch times of the two observations.

The declination of the body is supposed to be constant in the interval between the sights, which is practically true for the sun and planets; but when the moon is used a correction must be made for the change in declination, and this applies also when Plates II and III are used for finding the azimuth of the moon.

Ordinarily the value of Δ, h to be used in formula (24) may be found from those given in the tables by interpolating for minutes of latitude and declination. Where greater accuracy is required the value of Δ, h should be found from formula (4), as, for instance, when (25) is used for finding the longitude.

PLATE III.

TIME-AZIMUTH DIAGRAM.

This is sometimes more convenient than Plate II for finding the azimuth and position angle. Near the prime vertical it is necessary for the time to change the altitude one minute to be very accurately known. Rules 1, 2, 3, 4 and 5 and remarks under Plate II, apply to Plate III.

Equation of Equal Altitudes.

Mr. G. W. Littlehales, Hydrographic Engineer, U. S. Hydrographic Office, has derived the following formula for this equation in which it is necessary to know the value of the position angle:

$$(26) \quad t \cdot dt = - \frac{t}{15} \sec d \cot M \, dd.$$

In (26) $t = \frac{1}{2}$ the elapsed time between the A.M. and P.M. altitudes.

Quoting from Mr. Littlehales' article in No. 128 of the U. S. Naval Institute:

"This equation, besides being much easier to compute, is rid of the ambiguities of sign which attach to each of the two terms that compose the right-hand member of the usual form of the equation. It will be observed that in this form the correction does not change sign unless the position-angle changes from a value less than 90° to a value greater than 90° ; and that when the position-angle has a value of 90° , the 'equation' vanishes. We may, therefore, lay down the simple rule that, for values of the position-angle less than 90° , the correction should be added when the polar distance is increasing and subtracted when the polar distance is

decreasing; and, for values of the position-angle greater than 90° , the reverse is the case."

On Plates II and III, if the declination be used instead of the latitude, then the position angle or its supplement will be found in place of the azimuth, and the same rule applies to the azimuth tables, where by interchanging the latitude and the declination the position angle is found in place of the azimuth.

The position angle may also be found from Plate VI. When the hour angle is small it is better to use Plate III, as it is seen that with the aid of the vertical lines for interpolating the exact value of the position angle may be easily determined.

EXAMPLE 1. — Niquero, Cuba, February 5, 1908, lat. $20^\circ 02' 30''$ N., long. $77^\circ 35' 20''$ W., observed the following altitudes $\odot$ for chronometer error. $C - W = 5^h 22^m 47^s$ A.M.; $C - W = 5^h 22^m 45^s$ P.M.

A.M. Watch Times.		A.M. Altitudes.	P.M. Watch Times.		P.M. Altitudes.
h. m. s.			h. m. s.		
8 55 36.5		$63^\circ 00'$	3 04 33.3		$64^\circ 00'$
55 55.5 ✓		10	04 59.6		50
56 28.5		20	05 25.7		40
56 55		30	05 53.6		30
57 19.5		40	06 18		20
57 48		50	06 44		10
58 14.3		$64^\circ 00'$	07 09.3		$63^\circ 00'$

The altitude here changes $30'$ in 156 seconds, or $1'$ in 5.2 seconds, or in one minute the altitude changes $11.54'$ and we find $M = 53^\circ$.

We find middle chronometer time —	Elapsed time — 6 08 56
5 24 09	Dec. = $16^\circ 11' 14''$ S.
Eq. E.A. — 07.2°	Eq. time 14 07
5 24 01.8	Corrected for local
Eq. t — 14 07	apparent noon. Eq. time
5 09 54.8	to be subtracted from mean time.
Long. 5 10 20 West.	H.D. for Dec., + $44.83''$.
Chro. 0 00 25.2	
slow G.M.T.	

	$t = 3.0744$	log 0.4878
	15	colog 8.8239
The same result was	$d = 16^\circ 11' 14''$	sec 0.0176
obtained by the or-	$M = 53^\circ$	cot 9.8771
inary method.	$dd = + 44.83''$	log 1.6516
	$t.dt = 7.21$ sec.	log 0.8580

Hence Eq. E.A. = — 7.21 sec.

As the log cot M is the same as the log cot $(180^\circ - M)$ it is immaterial which is used in the computation, but we must know whether M is greater or less than 90°

to determine the sign of the correction $t.d.t$, which is easily determined from Fig. 2 or getting the approximate value from the Azimuth Tables.

Fig. 2 is the celestial sphere projected on the plane of the horizon. P , elevated pole; Z , zenith of the observer; WQE , equator; and WZE , the prime vertical.

1. Let L and d have the same name and $d > L$; then the value of M varies from 0° where the body crosses the lower branch of the meridian to 180° where it crosses the upper branch, being 90° when the diurnal circle is tangent to the vertical circle at its maximum elongation.
2. Let L and d have the same name and $L > d$. In this case M' varies from its maximum when in the horizon to 0° when on the meridian.
3. Let L and d be of contrary names, then M'' is always less than 90° while the body is above the horizon.

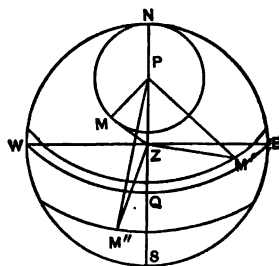

Fig. 2.

PLATES IV AND V.

ERROR IN THE LATITUDE DUE TO AN ERROR OF ONE MINUTE OF TIME IN THE HOUR ANGLE OR LONGITUDE.

Plate V is a continuation of Plate IV. These plates afford a convenient means of plotting lines of position without the aid of parallel rulers or protractors of any kind, and are therefore a great convenience on board ship. After finding the ship's position for a given longitude, assume an error of one minute of time or 15' of arc in the longitude, with the latitude and azimuth of the body find the correction from Plate IV or V, which lay off on the new meridian so as to make the line of position thus established come at right angles to the line of azimuth passing through the body.

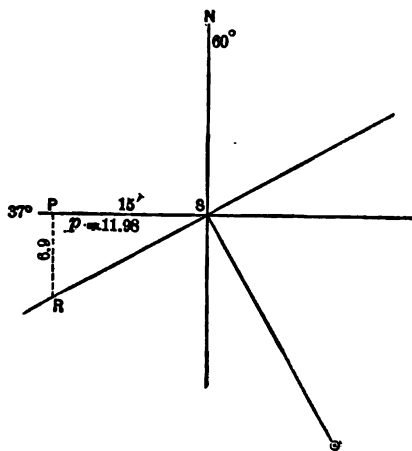

FIG. 3.

EXAMPLE 2. — Let S be the position of the ship in lat. 37° N., long. 60° W., the sun bearing S. 30° E., plot the line of position.

The line runs N. 60° E., or S. 60° W. Lay off $PS = 15'$ of longitude on the parallel 37° . From Plate V, $\Delta L = 6.9'$, take on the meridian through P , $PR =$

$\Delta L = 6.9'$, then RS is the required line of position, which is easily proved thus: $\tan Z = \frac{PR}{p}$, where p = the departure corresponding to $PS = 15'$ longitude in latitude $37^\circ = 11.98'$, and we find $Z = S. 29^\circ 57' E.$

If the chart used is on a large scale, make $PS = 5'$ of longitude, then $\Delta L = 2.3'$. If a small scale chart is used, make $PS = 30'$ and multiply ΔL taken from the plate by 2.

PLATE VI.

STAR-FINDING DIAGRAM.

To be used in connection with the Azimuth Tables and Plate II for the identification of stars in cloudy weather.

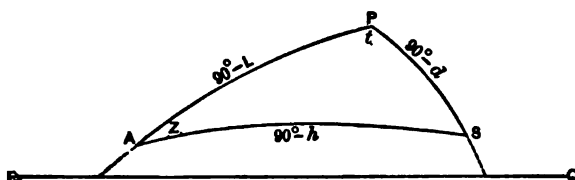

FIG. 4.

In Fig. 4, P is the elevated pole, A the zenith of the observer, and S the position of the star.

Given $AP = 90^\circ - L$, $AS = 90^\circ - h$, and Z = the azimuth; to find t = the hour angle and d = the declination.

Reduce the observed altitude and azimuth to true and find the local sidereal time at ship.

Shift the pole of the triangle PAS from P to A ; then renaming the parts as shown in Fig. 5, we find the hour angle thus:

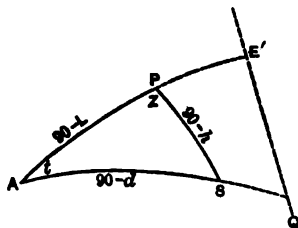

FIG. 5.

Enter the Azimuth Tables in the latitude of the ship with the azimuth as an hour angle and the altitude as a declination; the corresponding azimuth is the hour angle of the star; then

$$(27) \quad \cos d = \sin Z \cos h \operatorname{cosec} t.$$

Plate VI shows the relation expressed in formula (27) or

$$(28) \quad \sin t \cos d = \sin Z \cos h,$$

from which the declination is found after finding the hour angle from the Azimuth Tables, the azimuth having been observed or found from the azimuth diagram.

To find the star's declination from the diagram.

Enter with the azimuth on the margin; the intersection of the horizontal line through this point with the curve corresponding to the true altitude fixes a vertical line the intersection of which with the horizontal line corresponding to the hour angle previously found, determines the curve corresponding to the declination of the body.

This diagram also shows the relation

(29) $\sin Z \cos L = \sin M \cos d$, from which the position angle M of a given body may be found thus:

Enter with the azimuth on the margin; the intersection of the horizontal line through this point with the curve corresponding to the latitude fixes a vertical line the intersection of which with the curve corresponding to the given declination, determines the horizontal line corresponding to the position angle of the body.

Supplementary azimuths, hour angles, and position angles are given on the right-hand margin.

Ordinarily the azimuth may be observed with sufficient accuracy for the purpose of identification, but it is not always convenient to take the bearings, and conditions may be such as to make them inaccurate. In such cases take several altitudes, noting the time, and find C'_1 , the change in altitude in one minute, and then find the azimuth from Plate II. To be exact C'_1 should be corrected for the run of the ship, but in identifying stars this correction may, as a rule, be neglected.

It is always best to take a compass bearing as a check, even though a rough one, as this, with the altitude and latitude, will enable the observer to decide whether the latitude and declination are of the same or contrary names. This is necessary in order to find the hour angle from the azimuth tables.

There will be no difficulty in determining the names of the declination except when the star is near the equator. After finding the declination it is well to verify the name by entering the Azimuth Tables with the hour angle and this declination to see whether the azimuth so found agrees with that used.

In all cases the name of the declination may be readily found from the following table for which the writer is indebted to Professor H. L. Rice, U. S. Navy.

	0°	10°	20°	30°	40°	50°	60°	70°	80°	90°	

Express the latitude in degrees and tenths as B in the table.

Mark north latitude + and south latitude -.

When the azimuth is found at the top of the Table B is +.

When the azimuth is found at the bottom of the Table B is -.

The declination has the sign of $B + \frac{\text{latitude}}{5}$.

EXAMPLE 3. — At sea, February 26, 1901, 6.30 P.M., L.M.T., weather overcast and cloudy, observed the altitude of an unknown star of about the second magnitude, through a break in the clouds, $29^{\circ} 30'$ (true), bearing N. 74° W. (true). Lat. by dead reckoning 35° N., long. 60° W. What is the name of the star?

	74° = 4 hrs. 56 min.		
		h	m s
L.M.T.	6	30	00
R.A.M.S.	22	22	33
Cor. G.M.T.		1	43
L.S.T.	4	54	16
Star H.A.	4	49	36
Star R.A.	0	04	40

Entering the Azimuth Tables (H.O. No. 120) in lat. 35° , latitude and declination same name, with 4 hrs. 56 min. as an hour angle and for $29^{\circ} 30'$ dec., we find the azimuth $72^{\circ} 24'$ = 4 hrs. 49 min. 36 sec. the required hour angle.

Then from Plate VI we find the declination = $28^{\circ} 30'$ N.

R.A. of star = 0 hrs. 04 min. 40 sec.

Dec. of star = $28^{\circ} 30'$ N. In the Nautical Almanac these correspond to α Andromedæ, R.A. 0 hrs. 03 min. 19 sec.

Dec. $28^{\circ} 33'$ N.

EXAMPLE 4. — At sea, February 6, 1903, lat. $15^{\circ} 53'$ S., long. $38^{\circ} 12'$ W.; observed the following altitudes of a star bearing about W.N.W. Cloudy weather with heavy sea and too much motion on the ship to obtain a bearing by compass. What star was observed?

Obs. altitudes		Watch times		
°	'	h	m	s

Cor. G.M.T.		03	16.2
G.S.T.	16	55	45.6
Long.	2	32	48 (W)
L.S.T.	14	22	57.6
Star's H.A.	4	18	00
Star's R.A.	10	04	57.6

$t = 64^{\circ} 30' = 4$ hrs. 18 min.

Entering Plate VI with azimuth = $S. 110^{\circ} 25' W.$

Altitude = $19^{\circ} 51' 20''$; hour angle $64^{\circ} 30'$; we find declination = $12^{\circ} 30'$ N. Check the declination and hour angle by entering the Azimuth Tables and we find the azimuth agrees with that used in the problem.

EXAMPLE 5. — At sea, August 10, 1904, about 5.30 A.M., lat. $11^{\circ} 37' N.$, long. $81^{\circ} 09' W.$ Correction for dip, refraction and I.C. — $9' 00''$. Observed the following altitudes of a bright star bearing about E.S.E.

Watch times	Obs. altitudes
h m s	° ' "
5 24 35	23 36 00
26 55	24 07 30
35 43	26 04 00

When the watch showed 5 hrs. 35 min. 43 sec. the G.S.T. was 8 hrs. 12 min. 17 sec. As the ship was rolling heavily no accurate bearing could be taken. What was the star?

It is evident from the approximate bearing and the altitude that the star is in south declination. When $d = 0$, meridian altitude = $90^{\circ} - L = 79^{\circ} 23'$ in this case, evidently too great an altitude for this star to reach.

From the difference of altitudes divided by the number of minutes in the interval we find $C_1' = 13.3'$, and from Plate II we find $Z = S. 65^{\circ} E.$

	h	m	s
G.S.T. of obs.	8	12	17
Long. west	5	24	36
L.S.T.	2	47	41
Star's H.A.	3	52	16 (East)
Star's R.A.	6	39	57

To find the hour angle in this case we must enter the Azimuth Tables with the supplement of the azimuth found from Plate II = $115^{\circ} = 7$ hrs. 40 min. as an hour angle, and in the 26 column we find $58^{\circ} 04' = 3$ hrs. 52 min. 16 sec. for the hour angle of the star.

From Plate VI, with $Z = S. 65^{\circ} E.$, altitude = $25^{\circ} 55'$, and hour angle = $58^{\circ} 04'$, we find declination = $16^{\circ} 30' S.$

Star's R.A. 6 hrs. 40 min. 7 sec., Star's Dec. $16^{\circ} 30' S.$

These correspond to α Canis Majoris (Sirius),

R.A. 6 hrs. 40 min., 55 sec., Dec. $16^{\circ} 35' S.$

When the star is on or very near the meridian so that its hour angle is practically 0, the star's right ascension is equal to the local sidereal time, and its declination may be readily found by looking in the Ex-Meridian Tables in the latitude by dead reckoning for the meridian altitude of the star, and in the same column at the top will be found the declination. If the azimuth is so great that the hour angle must be taken into account in computing the right ascension, then proceed as in Examples 3, 4, and 5. Or having found the hour angle from the azimuth and altitude, we may take out the approximate correction from the Ex-Meridian Tables, which added to the observed altitude for upper passage, or subtracted for lower, will give the meridian altitude, from which the declination may be found as when the star is on the meridian.*

To Identify a Star with the Aid of a Great Circle Sailing Chart.

As azimuth tables for the higher declinations are not always available the following method is given.

If we use the Great Circle chart of the North Atlantic Ocean:

On the meridian of Greenwich, or any convenient meridian, mark the point S in a latitude equal to h , the true altitude of the star. Mark A , the position of the ship in latitude, L , and in longitude from S equal to the true azimuth

* When the star is near the prime vertical, find the Latitude in Table IX, and look for the altitude in the same line. The declination will be found at the head of the column, and the hour angle under this declination and in the same line as the altitude.

of the star, Z . Find the Great Circle course and distance between A and S by the method of the chart. The course is the hour angle of S and the distance is the complement of the declination.

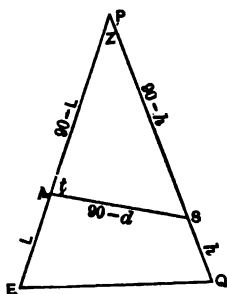

Fig. 6.

When the latitude and the declination are of contrary names, proceed as directed on the chart for finding the course and distance between two places on opposite sides of the equator.

The following examples illustrate the use of the tables and plates.

EXAMPLE 6. — At sea, June 30, 1904, lat. $37^{\circ} 33' S$, long. $24^{\circ} 00' E$. by D.R., Local Ap. Time 0 hrs. 23 min., observed altitude sun's lower limb $29^{\circ} 10'$, height of eye 28.5 feet, declination $23^{\circ} 11' 48'' N$. Find the latitude and plot the line of position.

From page 223, column 23, we have $\Delta h = +16' 02''$	$\Delta h = 1.66''$
Correction Table V for 1 min. H.A.	$- 1' 15''$
Correction Table VI	$- 15''$
	$\Delta h = 14' 32''$
	$Cd = \frac{1.66 \times 23}{30} = 1.27''$

Obs. Alt. Sun's l.l.	$29^{\circ} 10' 00''$
Cor. Table II	$+ 9 05$
True Alt. Sun's c.	$29^{\circ} 19' 05''$
Δh	$+ 14 32$
Mer. Alt.	$29^{\circ} 33' 37''$
	90
Mer. Z. Dist.	$60^{\circ} 26' 23'' S$
Declination	$23 11 48 N$
Latitude	$37^{\circ} 14' 35'' S$
Cor. Table VII	$- 7$
True Lat.	$37^{\circ} 14' 28'' S$

From Plate II,
 $Z = 6^{\circ} 30'$
 $M = 6^{\circ} 00'$

From an inspection of the tables we see that an increase in both latitude and declination causes a decrease in Δh , and as Z and M are practically equal we may enter Table VI with $45'$ and 6° and take out both corrections at once — $15''$.

Lat. by D.R. $37^{\circ} 33' 00''$
 Lat. by calc. $37 14 35$

Diff. $18' 25''$
 Cor. Table VII $7''$
 To be subtracted to make good the relation D.R. — Calc. — True.

When Z and M are so small the corrections from Tables VI and VII may be omitted without any appreciable error.

Enter Plate IV with $Z = 6^{\circ} 30'$ and $L = 37^{\circ} 15'$; we find the error in latitude due to $15'$ error in longitude = $1.33'$; so as the sun is in the N.W. quadrant the

line runs from N.E. to S.W. quadrant. Lay off 15' long. to W'd and 1.33' to the S'd and join the latter point with the assumed position of the ship, Fig. 7.

EXAMPLE 7. — March 20, 1907, about 8.15 P.M., lat. 50° 14' N., long. 1° 39' W. by D.R., the observed altitude of Castor was 70° 01' 02" bearing to the S'd and W'd, chronometer time of observation 8 hrs. 49 min. 17 sec., chronometer fast of G.M.T. 0 hrs. 16 min. 7 sec. Find the latitude and plot the line of position.

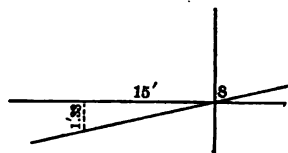

FIG. 7.

Castor, Right Ascension 7 hrs. 28 min. 40 sec.

L.S.T.	8	15	26	Dec.	32 05 36 N.
Star's R.A.	7	28	40	Latitude	50° 13' 30" N.
Star's H.A.	0	46	46		

On page 299 we find that for $t = 46.76$ min., Δh is not tabulated, as 46. min. exceeds the limiting hour angle where the second reduction may be neglected. From formula (21), $\Delta h = 126.1'$.

We have $\Delta h = 3.46''$	$\log 0.53908$	$\Delta h = + 126.1'$
$t = 46.76$	$2 \log 3.33974$	2d Red. = — 7.1
60	$\text{colog } 8.22185$	+ 119.0'
$\Delta h = 126.1$	$\log 2.10067$	Table VI — 2.2
		Total Red. = + 116.8'

On page 299 in column 32° we find meridian altitude = 72°, and from Plate I second reduction = 7.1'.

$$\text{Formula (22)} \quad C_1 = \frac{\Delta h \times t}{30} = \frac{3.46'' \times 46.76}{30} = 5.78'.$$

From Plate II, $Z = S. 37^\circ W.$; $M = 27^\circ$.

Table VI, cor. for 14' lat. = — 2.82'; Table VI, cor. for 5.6 dec. = + .6'.

Total correction for minutes of lat. and dec. = — 2.22'.

With azimuth 37° enter Plate IV, and we find error in latitude for 15' longitude = 7.24'. As the star is in the third quadrant the line must run through the second and fourth to N'd and W'd, and S'd and E'd. Lay off 15' longitude to the westward of the position and 7.24' latitude to the north. The line through this point and the ship's position is the line of position required.

EXAMPLE 8. — August 6, 1907, lat. $59^{\circ} 00' S.$, long. $175^{\circ} 27' E.$, during evening twilight, observed altitude α Eriadni (Achernar) near lower transit $26^{\circ} 52' 00''$, watch time 4 hrs. 31 min. 12 sec., $C - W = 0$ hrs. 18 min. 7 sec., chronometer fast G.M.T. 0 hrs. 12 min. 42 sec., I.C. $+ 1' 20''$, height of eye 24 feet. L.S.T.	$\begin{array}{r} 13 \\ 12 \\ 41.2 \end{array}$	Mer. Alt. $= h_o = 26^{\circ} 41' 58''$
12 h. + Star's R.A. $\begin{array}{r} 13 \\ 34 \\ 15.1 \end{array}$		$p = 32' 17' 27''$
Star's H.A. $= t = \begin{array}{r} 0 \\ 21 \\ 33.9 \end{array}$		Latitude $58^{\circ} 59' 25''$ South.

Page 357, column 57, $\Delta h = 0.61''$, $C_i = \frac{0.61'' \times 21.55}{30} = 0.44''$.

From Plate II, $Z = S. 3\frac{1}{2}^{\circ} W.$; $M = 3\frac{1}{2}^{\circ}$. M is so small that the correction for $42'$ dec. is not sensible.

$$\begin{array}{r} \Delta h = 4' 02'' \\ \text{Cor. Table V for 1.55 min.} \quad = + 38 \\ \hline \Delta h = 4' 40'' \end{array}$$

The star being near the lower transit, Δh must be subtracted from the true altitude.

EXAMPLE 9. — At Niquero, Cuba, March 5, 1908, approximate position, lat. $20^{\circ} N.$, long. $77^{\circ} 30' W.$, observed the following altitudes of the sun's lower limb with artificial horizon:

Watch time $\begin{array}{r} h \\ 11 \\ m \\ 55 \\ s \\ 51.5 \end{array}$	2 Altitude $\begin{array}{r} 126^{\circ} 20' 30'' \\ 127 \quad 03 \quad 30 \end{array}$
$\begin{array}{r} 12 \\ 05 \\ 25 \end{array}$	

$C - W = 5$ hrs. 4 min. 18 sec. Chronometer 49.76 sec. slow G.M.T. Find the longitude and the latitude.

$$\text{We have, formula (25), } t = \frac{C_i \times 30}{\Delta_1 h}.$$

Let h' = lower altitude for upper transit.

T' = corresponding watch time.

h'' = higher altitude for upper transit.

T'' = corresponding watch time.

$$\frac{T' + T''}{2} = T_m = \text{middle watch time.}$$

$T'' - T' = i$ = interval between sights in minutes.

$h'' - h' = D$ = difference of altitudes in minutes of arc.

The hour angle t , found by the above formula (25), corresponds to T_m , and

$$C_i = \frac{D}{i} = \frac{21.5' \times 60}{573.5}.$$

From page 121 we find $\Delta_1 h = 4.19''$, hence $t = \frac{21.5 \times 1800}{573.5 \times 4.19}$.

T_m	h	m	s	G.A.T.	4	54	06.95
$C - W$	-5	04	18	L.A.T.	11	43	53.4
Chro. Time	5	04	56.25	Long.	5	10	13.55
				Long. $77^\circ 33' 23''$ West.			
				The true longitude is $77^\circ 35' 07''$.			
Chro. Cor.			+ 49.76	21.5	log	1.33244	
G.M.T.	5	05	46.01	1800	log	3.25527	
Eq. Time (- M.T.)		11	39.06	573.5	colog	7.24147	
G.A.T.	4	54	06.95	4.19	colog	9.37779	
				$t = 16.11$	log	1.20697	
				$t = 16$ min. 06.6 sec. (East)*			

To find the latitude corresponding to this hour angle it is necessary to find the altitude corresponding to the middle watch time.

It will be found more convenient, however, to find the hour angle corresponding to one of the altitudes by applying $\frac{1}{2} i$ to the hour angle t , already found.

Let $t' =$ hour angle corresponding to h' , the lower altitude.

$t'' =$ hour angle corresponding to h'' , the higher altitude.

Then $t' = t + \frac{1}{2} i$,

and $t'' = t - \frac{1}{2} i$; we have $i = T'' - T' = 9$ min. 33.5 sec.

$\frac{1}{2} i = 4$ min. 46.7 sec., and $t' = 20.9$ min.

$t'' = 11.33$ min.

2 obs. alt.	$126^\circ 20' 30''$	$C_1 = \frac{20.9 \times 4.19}{.30} = 2.92$
I.C.	+ 0 15

	90°	
M.Z.D.	$26^\circ 03' 14''$ North	The latitude from h'' is $20^\circ 02' 50''$.
Dec.	6 00 24 South	Mean latitude $20^\circ 02' 46''$.
Latitude	$20^\circ 02' 50''$ North	True latitude = $20^\circ 02' 40''$ North.

* If $\Delta_1 h$ be computed by formula (4), using the true latitude, we find $\Delta_1 h = 4' .177''$ and longitude = $77^\circ 34' 03.75''$, only $1' 03.75''$ less than the true longitude.

EXAMPLE 10. — U. S. S. Dubuque, at sea, off Cape Hatteras, June 23, 1908; lat. $33^{\circ} 33' N.$, long. $75^{\circ} 26' W.$, from A.M. time sight, observed the following altitudes of the sun's lower limb near noon:

A.M.			P.M.		
	Watch.	Altitudes.		Watch.	Altitudes.
(1)	11h 47m 08.5s	$79^{\circ} 19' 30''$	(3)	12h 05m 52s	$79^{\circ} 38' 50''$
(2)	57 58	42 30	(4)	10 56.5	26 40

$C - W = 4$ hrs. 55 min. 05 sec. Chronometer slow G.M.T. 0 hrs. 11 min. 40 sec. Sun's declination, corrected, $23^{\circ} 26' 20'' N.$ $\Delta, h = 8.57''$ computed by formula (4); height of eye 20 feet; corrected equation of time, to be subtracted from mean time = 1 min. 55 sec. Course North, true; speed, 10 knots. Find the Longitude and Latitude at noon.

ANSWERS.

From A.M. Observations.

Long. $75^{\circ} 21.5' W.$

Lat. from (1) $33^{\circ} 31' 45'' N.$

" " (2) $33^{\circ} 32' 12'' N.$

From P.M. Observations.

Long. $75^{\circ} 22' W.$

Lat. from (3) $33^{\circ} 30' 57'' N.$

" " (4) $33^{\circ} 32' 00'' N.$

As the ship was in the Gulf Stream during the interval between the A.M. time sight and noon, the difference of longitude is accounted for by the current.

If the ship change her longitude in the interval between the observations, the hour angle should be corrected for this difference when appreciable, that is, a westerly difference of longitude should be added to an easterly hour angle and be subtracted from a westerly hour angle and an easterly difference of longitude should be added to a westerly hour angle and be subtracted from an easterly one; or more briefly, when both are east or both are west, subtract; when one is east and the other west, add.

When the azimuth exceeds three or four degrees the line of position, corresponding to the latitude found, should always be drawn when very exact results are required.

TABLE II.

Corrections for Dip, Refraction, Parallax, and Semi-Diameter and Dip and Refraction, to be applied to the Observed Altitude of the Sun's Lower Limb, or of a Star, to obtain the True Altitude. Barometer 30 inches = 76.2 centimeters. Thermometer 50° F. = 10° Centigrade = 8° R. Sun's Semi-Diameter, 16' 02".

Height of Observer's Eye, 20 feet = 6.1 metres.

TABLE IV.

Correction for Sun's Semi-Diameter.

Jan. + 15"	Feb. + 11"	March + 5"	April - 4"	May - 11"	June - 16"
July - 15"	August - 11"	Sept. - 5"	Oct. + 4"	Nov. + 11"	Dec. + 16"

The corrections in Table II for the Altitude of a Star may be used for the Planets also, as the Parallax is so small that it may ordinarily be neglected.

Thence, When the time is found in the numbers which run from right to left use the Latitude; the corresponding Azimuth will be found on the curves between 16° and 2°

TE OF TIME IN THE HOUR ANGLE OR LONGITUDE PLATE V.

Thus, When the time is found in the numbers which run from right to left use the Latitude; the corresponding Azimuth will be found on the curves between 16° and 27°

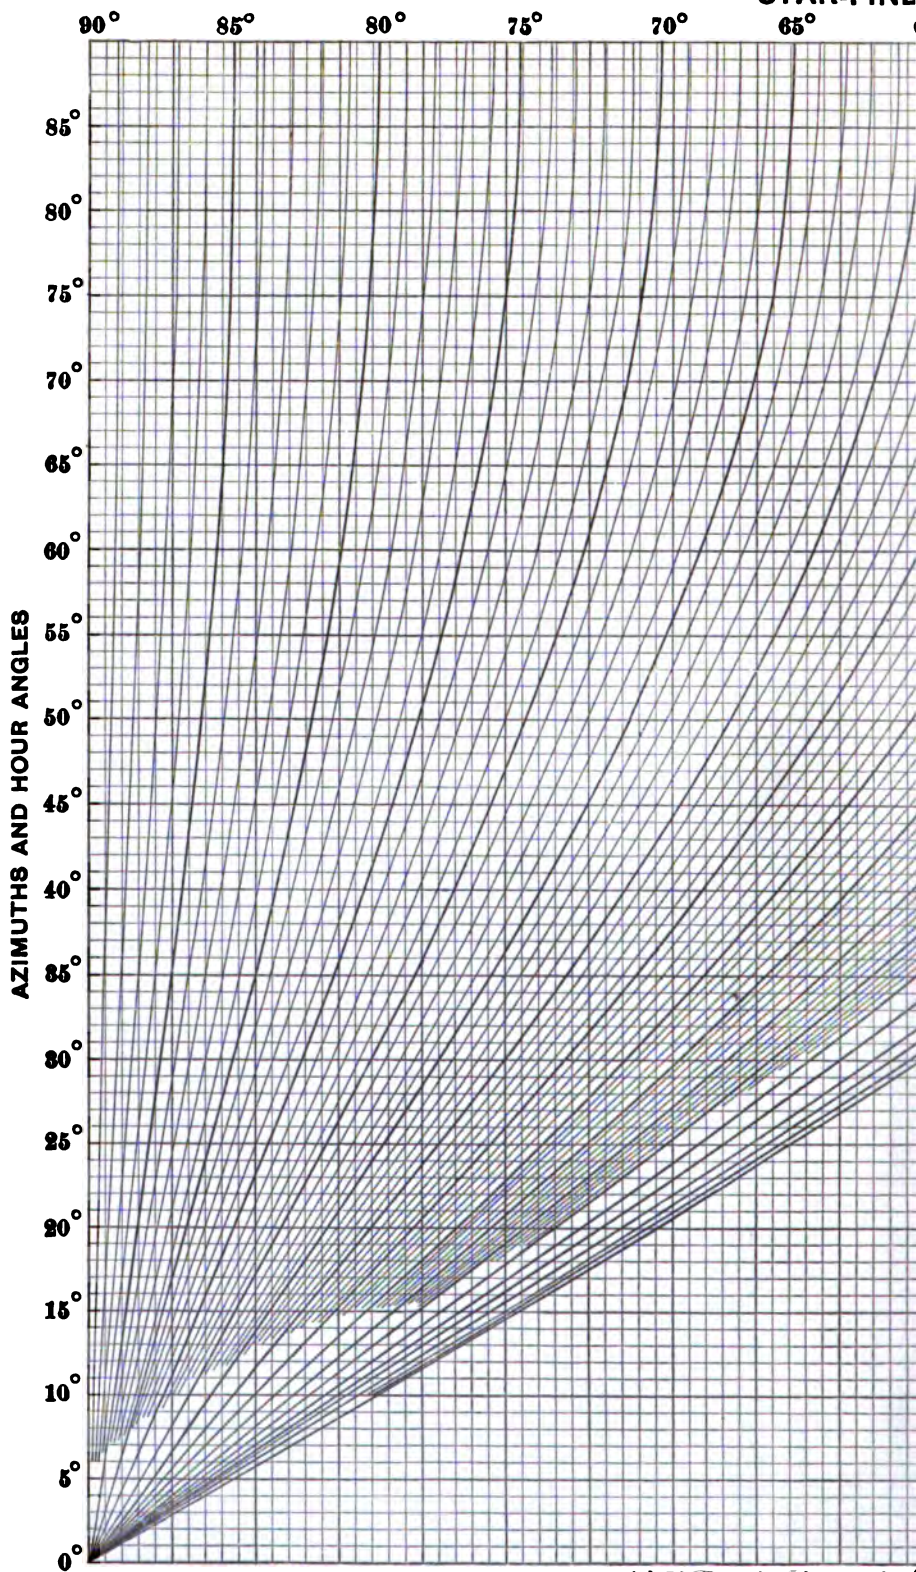

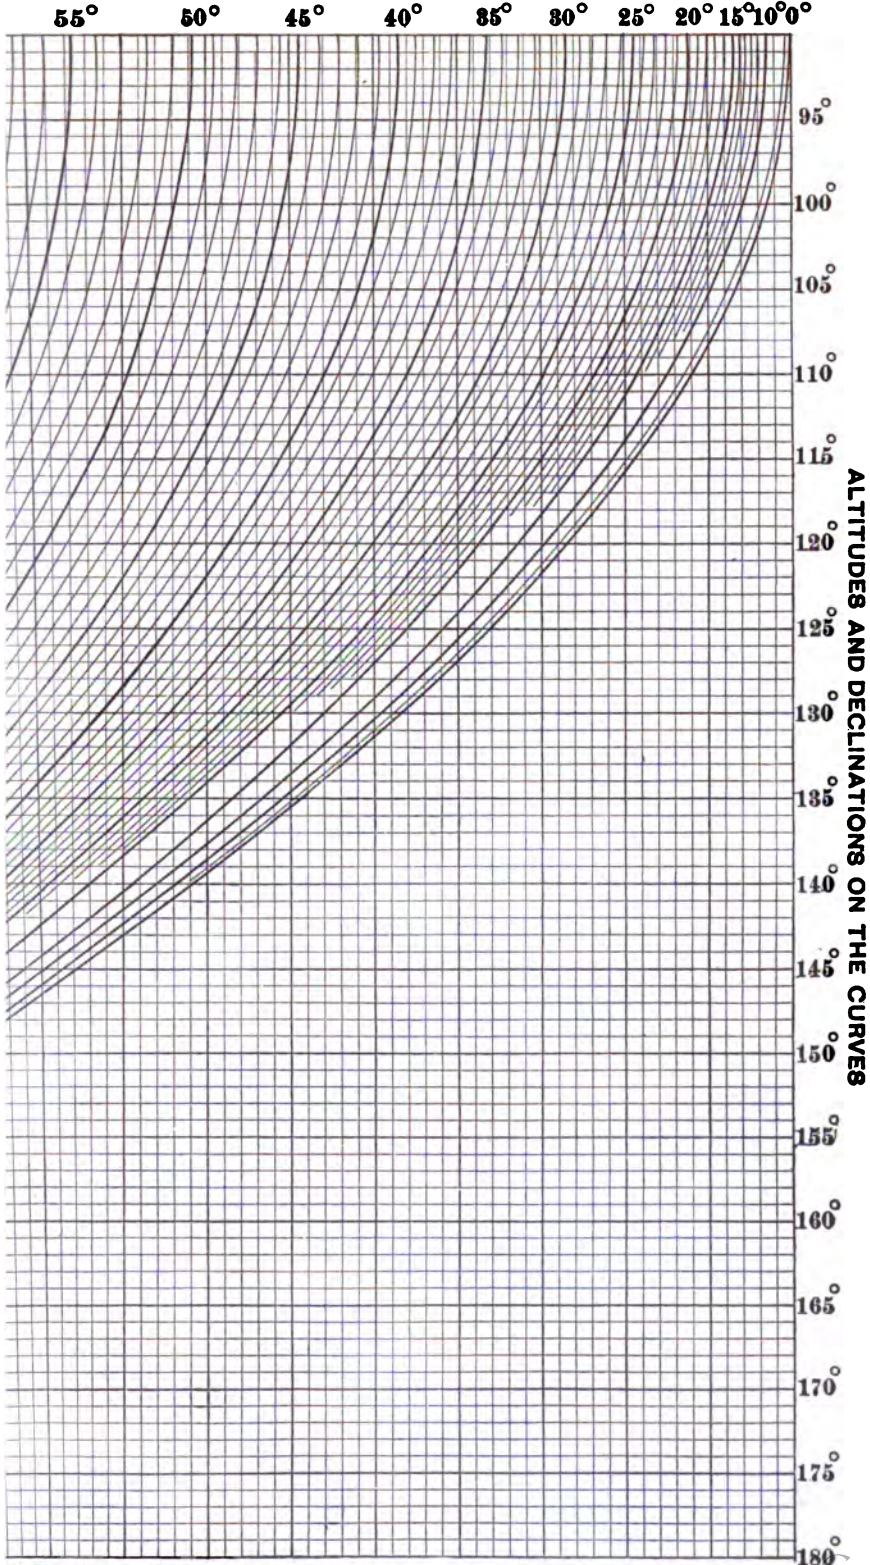

DIAGRAM.

PLATE VI.

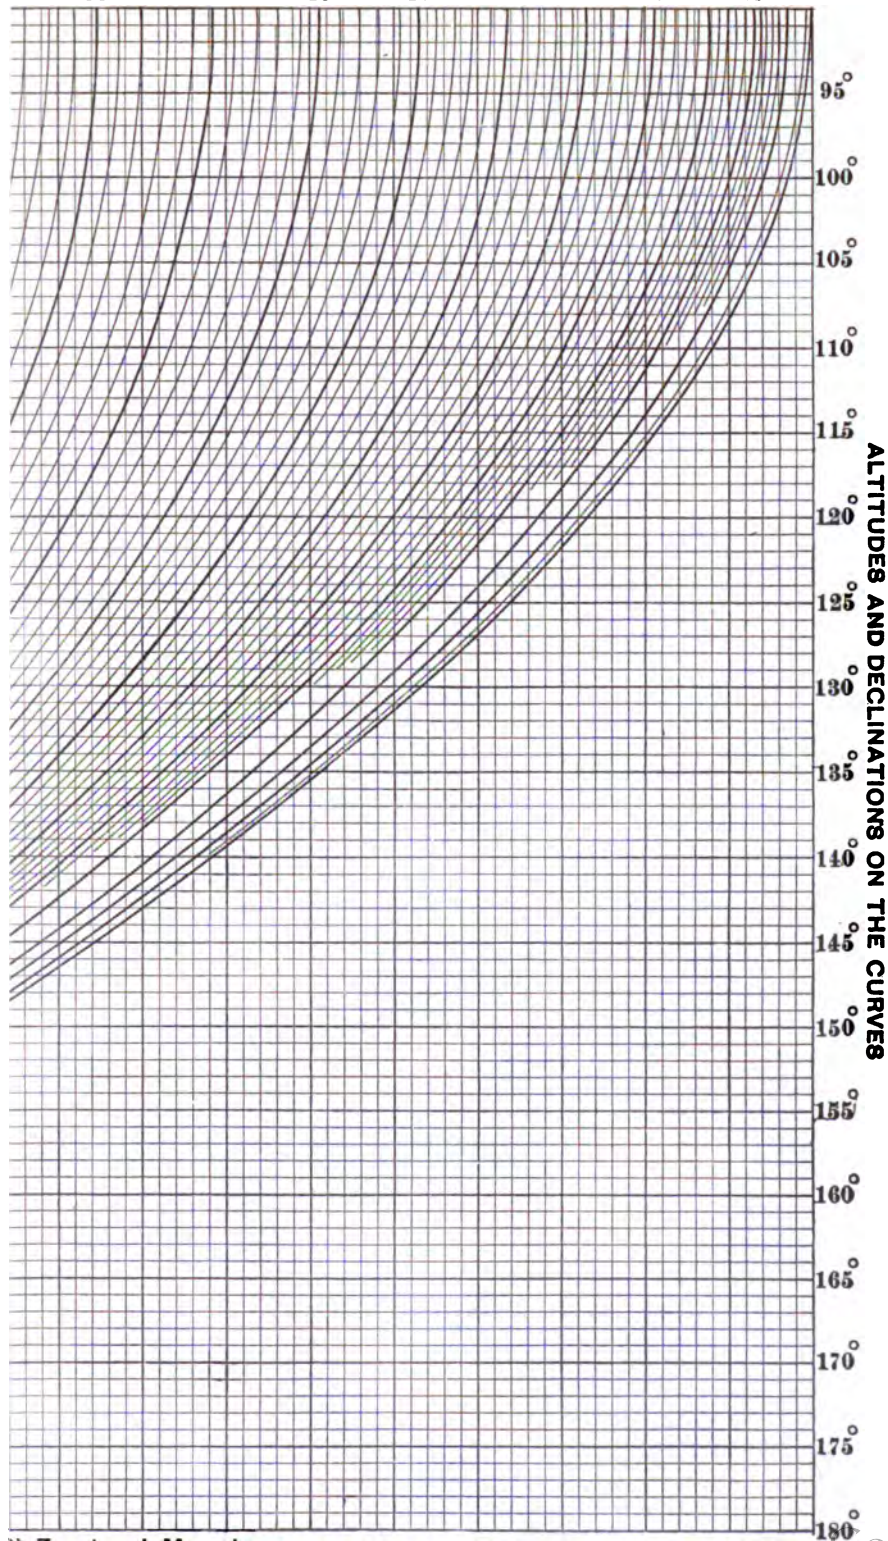

$\sin Z \cos L = \sin M \cos d.$
